1. INTRODUCTION

Casitas Municipal Water District (CMWD or Casitas), in cooperation with the Ventura County Watershed Protection District (VCWPD) and the U.S. Geological Service (USGS), collects hydrology data on the Ventura River system. Figure 1-1 shows the watershed boundaries including drainage areas, stream gaging stations, and weather stations. The hydrology data is a valuable asset for developing an understanding of the water resources of the Ventura River system. Since 1981, CMWD has summarized the data into a series of annual reports. This report presents information and data for the 2017–2018 Water Year (WY 2018) and 2018–2019 Water Year (WY 2019). Data is also presented for Calendar Years 2018 and 2019 for comparison to historical data.

Casitas acquired the Ojai Water System in June 2017 which serves approximately 3,000 customers. The main water source for this system is a wellfield which draws from the Ojai Valley Groundwater Basin, located within the San Antonio Creek Watershed, a sub-basin to the Ventura River Watershed. The Ojai Water System is supplemented by surface water deliveries from Casitas Reservoir (also referred to as Lake Casitas herein), particularly in times of drought and/or high demand when aquifers are typically depleted and well production is reduced or limited.

Ventura County experienced a major fire (the Thomas Fire) in WY 2018 which burned nearly the entire watershed, as shown in Figure 1-2. Hydrologic impacts following the Thomas Fire were observed in both the direct and indirect inflow sources of Lake Casitas. This included steeper hydrographs at increased magnitudes during storm events from a combination of hydrophobic soil limiting percolation rates and less vegetation to slow surface run-off. Heavy debris and sediment loads from slope erosion and streambed mobilization during high magnitude storm events impacted diversion capabilities at the Robles Diversion and Fish Passage Facility (Robles). Heavy debris loads clogged the diversion screens requiring frequent turnouts to manually clean the screens and replace brush motor sheave belts. Diversion capabilities were also reduced due to sediment in the Robles Screenbay and Forebay. Two shutdowns occurred in order to remove sediment from the Screenbay in the winter of 2019 and approximately 50,000 cubic yards of sediment was removed from the forebay in November 2019 in order to restore ponding capacity.

Post-fire run-off deposited fine sediment in the stream channels which appears to have reduced streambed percolation, resulting in prolonged spring and summer time streamflow, and an increased duration of surface connection between the upper portions of the Ventura River watershed and the Pacific Ocean. Historically, Robles does not experience surface flow during the summer and fall in all but well above-average rainfall years. Surface flow has been present at Robles since the first storm event following the Thomas Fire.

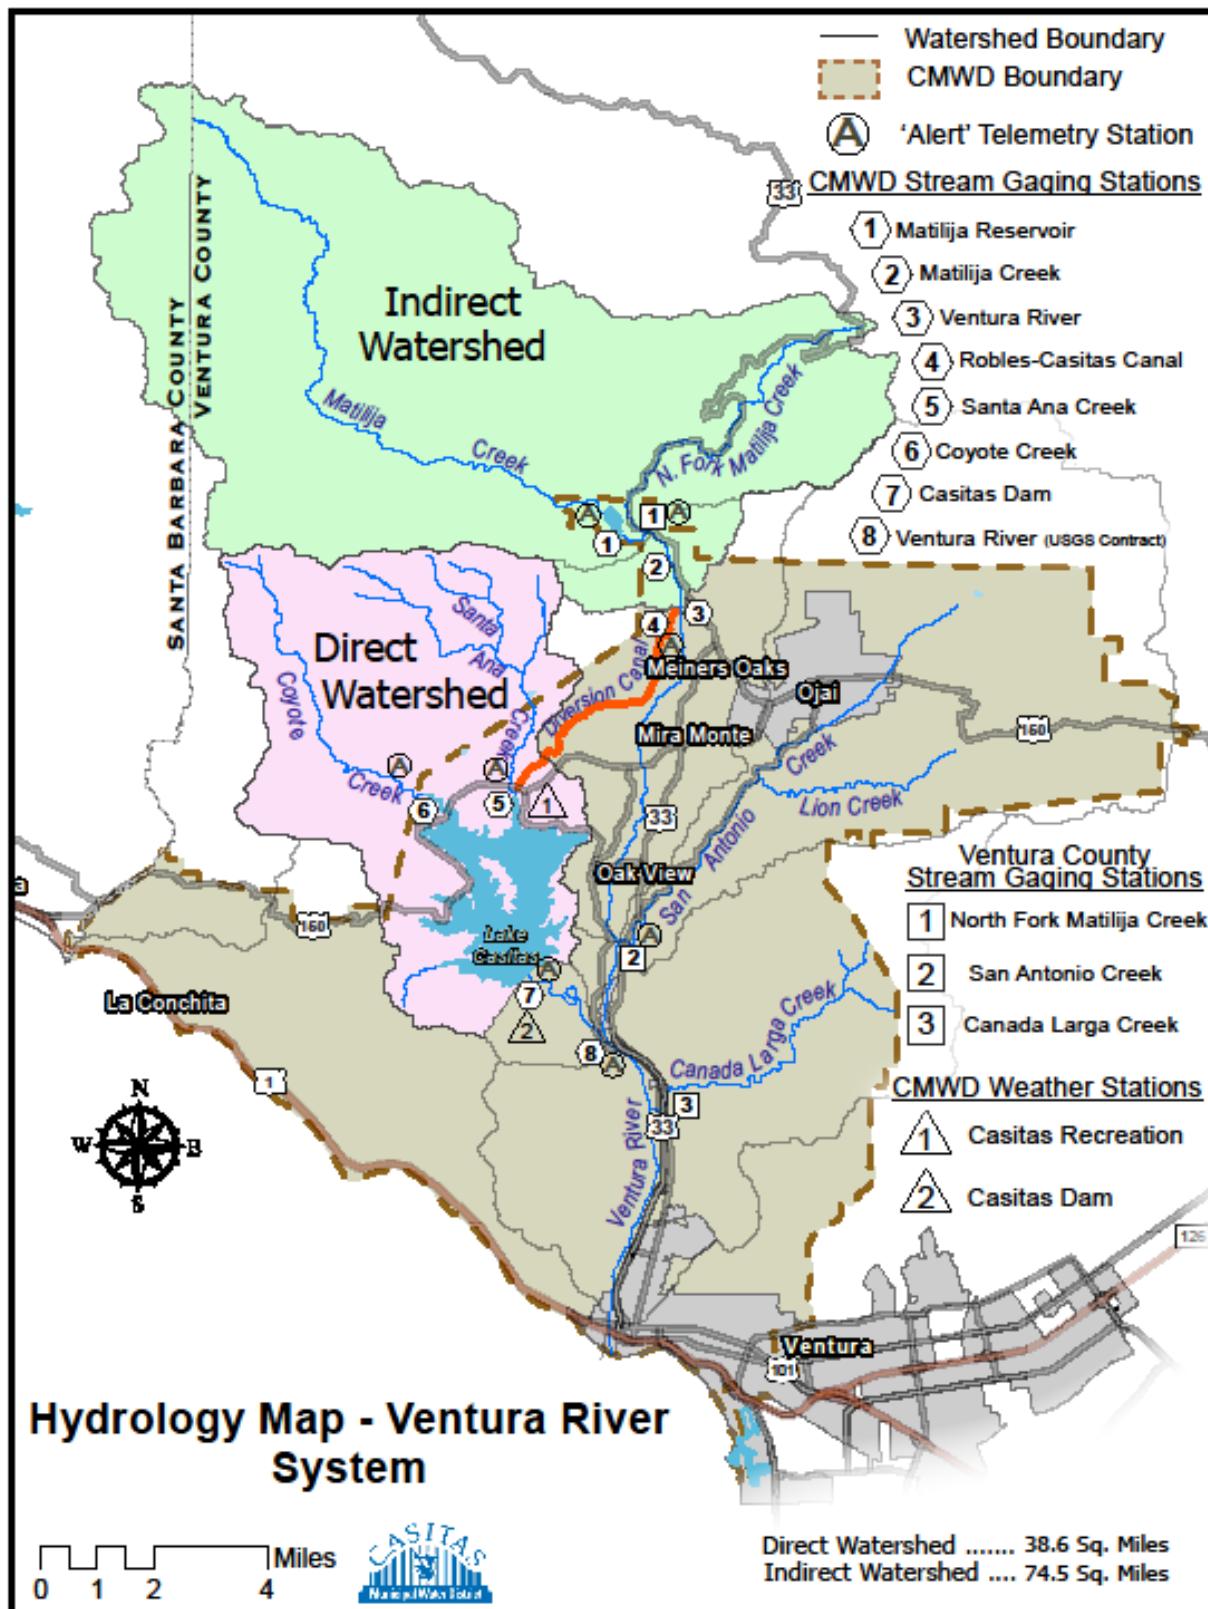

FIGURE 1-1 – Watershed of Lake Casitas

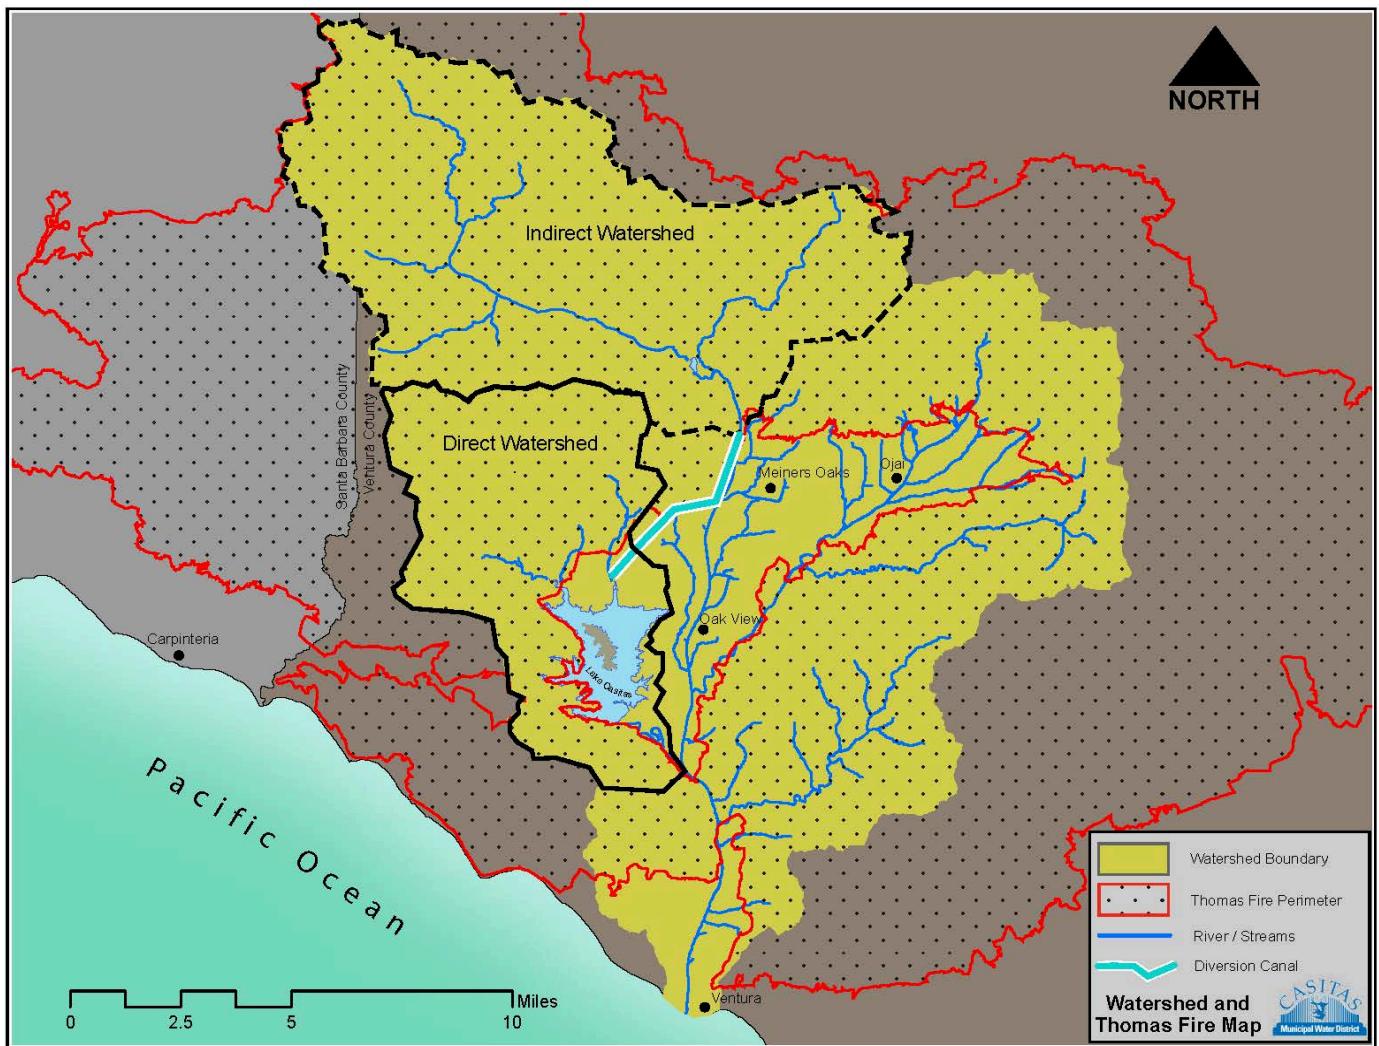

FIGURE 1-2 – Thomas Fire Boundary

Streamflow monitoring was also impacted by the Thomas Fire. Air lines at the Coyote Creek and Matilija gaging stations sustained fire damage and required repair. The heavy sediment load in subsequent storm events buried the orifices of the air lines at Santa Ana Creek, Coyote Creek, Matilija Creek, and Ventura River Near Meiners Oaks (VRNMO). Further discussion of the impacts and corrective actions taken is included in Section 2.2 herein.

Data from an additional rainfall station located on Ojai's East End and a San Antonio Creek gaging station were added to this report to reflect hydrologic conditions within the San Antonio Creek Watershed. Ojai Water System Sources and Deliveries were also added to this report. Reporting of the hydrologic aspects of this system may be expanded in the future as more data become available.

2. WATER YEARS 2018 AND 2019 SUMMARIES

The Water Year (WY) is a standard used for reporting hydrological cycles. It begins on October 1 of the preceding year and ends September 30 of the named water year. For this report:

- WY 2018 began on October 1, 2017 and ended September 30, 2018; and
- WY 2019 began on October 1, 2018 and ended September 30, 2019

There are four key elements of collected data evaluated this report: 1) rainfall, 2) streamflow conditions, 3) lake storage and system deliveries and 4) ambient air temperatures. Each of these elements are monitored and recorded by CMWD on a daily basis. The following subsections are summaries of the hydrologic characteristics of WY 2018 and 2019.

2.1.Rainfall

Rainfall and evaporation data are collected on a daily basis by Casitas at two stations, one at the Casitas Dam and one at the Lake Casitas Recreational Area (LCRA). The methods for data collection are standardized for consistency. Rainfall data for Matilija Dam and Thacher School are obtained from VCWPD. Raw data is provided in Appendix A.

2.1.1. WY 2018

The average of the four rainfall stations was 13.55 inches for WY 2018. This is below the long-term average of 24.02 inches. Casitas Dam received 11.49 inches while Matilija Dam received 17.03 inches.

The bulk of precipitation at Casitas Dam fell in the months of January and March, when cumulative monthly rainfall was 2.83 and 8.43 inches, respectively. The highest daily rainfall was recorded on January 9, 2018 with 2.10 inches of rainfall measured at Lake Casitas Recreation Area (LCRA).

2.1.2. WY 2019

The average of the four rainfall stations was 31.49 inches for WY 2019. This is above the long-term average of 24.15 inches. Casitas Dam received 29.49 inches while Matilija Dam received 39.75 inches.

The bulk of precipitation at Casitas Dam occurred in the months of January and February 2019, when cumulative monthly rainfall was 9.07 and 9.56 inches, respectively. The highest daily rainfall was recorded on February 2, 2019 with 2.75 inches of rainfall measured at Casitas Dam.

2.2.Streamflow Conditions

Streamflow conditions are assessed by collecting data at key points in the Ventura River system. Gage station locations are shown in Figure 1-1. Mean daily stream flow data is included in Appendix B.

2.2.1. WY 2018

Due to the drought, streamflow conditions were below average across the basin. Preliminary data provided by VCWPD indicates discharge from North Fork Matilija Creek totaled 3,028.6 acre-feet (AF) between October 1, 2017 and September 30, 2018. Discharge from Matilija Dam measured at the Matilija Hot Springs gage totaled 4,997 AF with a peak flow of approximately 6,200 cubic feet per second (cfs) on January 9, 2018¹.

Surface flow at the measurement weir at Robles was present beginning January 8, 2018 and lasted the entire WY. During that period, 8,417 AF was released downstream². Sediment transfer following the Thomas Fire may have impacted percolation and caused elevated surface flow to occur and continue longer than it would have otherwise for WY 2018 and 2019.

Diversions to the Casitas Reservoir began on March 21, 2018. Prior to March 21, all inflow was released downstream to allow for aquifer levels to rise to the extent that would be expected under natural conditions for the time of year and type of year (*Trial Operating Criteria for Robles Casitas Diversion Facilities*, 1959). The diversion canal was operated for 4 days and 638 AF was diverted during WY 2018 as shown in Table 2-1³.

**Table 2-1
WY 2018 Diversions**

Month	Days	Volume Diverted (AF)
October 2017	0	0
November 2017	0	0
December 2017	0	0
January 2018	0	0

March 2018	4	638
April 2018	0	0
May 2018	0	0
June 2018	0	0
July 2018	0	0
August 2018	0	0
September 2018	0	0
TOTAL	4	638

¹ Matilija Dam measurement from data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

² Robles weir measurement from data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

³ Robles canal measurement from data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

There were three storm peaks that met the Biological Opinion parameters to initiate supplemental downstream releases for fish passage as shown in Table 2-2. Downstream release requirements were met when Robles inflow was sufficient to do so. All flow was released downstream when inflow was less than the required supplemental release⁴.

**Table 2-2
WY 2018 Storm Peaks**

Date	Peak Storm Flow Rate (cfs)
January 9, 2018	8,809
March 21, 2018	418
March 22, 2018	3,044

Coyote Creek and Santa Ana Creek drainage areas contribute directly to Lake Casitas storage. Coyote Creek gaging station was damaged during the 2017 Thomas Fire (WY 2018) and subsequently repaired in January 2018. The Santa Ana Creek gaging station was not damaged; both Coyote Creek and Santa Ana Creek gaging stations, however, experienced heavy sediment transport and re-channelization following the fire, rendering poor quality flow data. Direct inflow into Lake Casitas, which is reported in the Casitas Reservoir Operation data (Appendix C), was used as a surrogate for Coyote and Santa Ana creeks as the major tributaries, but also accounts for other direct runoff including smaller tributaries such as Ayers, Chismahoo, Willow, and Poplin Creeks. Direct inflow is a zero sum calculation and accounts for change in Lake Casitas storage not accounted for by precipitation, Ventura River Diversions, evaporation, precipitation, and releases to the Marion Walker Water Treatment Plant. This value may be negative at times which is attributed to approximation in evaporation coefficients and water loss to infiltration. Only months with a positive direct inflow value are considered as a surrogate for true direct inflow into Lake Casitas and totaled 3,475 AF for WY 2018 with March 2018 accounting for 1,723 AF of total direct inflow as shown in Table 2-3⁵.

**Table 2-3
WY 2018 Casitas Reservoir Direct Inflow**

Month	Direct Flow Volume (AF) ⁶
October 2017	13
November 2017	N/A
December 2017	N/A
January 2018	795
February 2018	87
March 2018	1723
April 2018	225
May 2018	80
June 2018	177
July 2018	161
August 2018	159
September 2018	55
TOTAL	3,475

⁴ Storm peak flows can be found in Appendix C.

⁵ Direct inflow into Lake Casitas is shown in Appendix D.

⁶ N/A indicates the month is not applicable because the value was negative.

2.2.2. WY 2019

The above average rainfall along with several storm events contributed to significant run-off within the watershed. Preliminary data provided by VCWPD indicate discharge from North Fork Matilija Creek totaled 14,566 AF between October 1, 2018 and September 30, 2019. Discharge from Matilija Dam measured at the Matilija Hot Springs gage totaled 37,812 AF with a peak flow of approximately 1,353 cfs on January 17, 2019⁷.

Surface flow at the measurement weir at Robles was present beginning October 1, 2018 and lasted through September 30, 2019. During that period, 44,712 AF was released downstream to the Ventura River⁸. A portion of inflow is diverted when inflow exceeds downstream release criteria to: 1) allow for aquifer levels to rise to the extent that would be expected under natural conditions for the time of year and type of year (*Trial Operating Criteria for Robles Casitas Diversion Facilities, 1959*) and 2) provide supplemental downstream releases to allow for the migration of endangered southern California steelhead (*Biological Opinion for the Robles Diversion Fish Passage Facility, Ventura River, CA, 2003*). Periods of stream flow were estimated due to post-fire related sediment impacts to stream gaging instrumentation. Flow overtopping the cut-off wall during high flow events bypasses the measurement weir and is estimated during peak flow and is unable to be measured to calculate daily average discharges.

Diversions to the Casitas Reservoir first began on November 29, 2018. The diversion canal was operated for two days in November 2018 and one day in December 2018. Sufficient inflow for sustained diversions began on January 12, 2019. The diversion canal was operated for 140 days and 20,882 AF was diverted during WY 2019 as shown in Table 2-4⁹.

**Table 2-4
WY 2019 Diversions**

Month	Days	Volume Diverted (AF)
October 2018	0	0
November 2018	2	141
December 2018	1	50
January 2019	19	1,751
February 2019	26	8,506
March 2019	31	8,122
April 2019	30	1,523
May 2019	30	788
June 2019	1	1

August 2019	0	0
September 2019	0	0
TOTAL	140	20,882

⁷Matilija Dam measurement from data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

⁸ Robles weir measurement form data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

⁹ Total volume of water diverted to Lake Casitas from the Ventura River is shown in Appendix D.

There were nine storm peaks that met the Biological Opinion's parameters to initiate supplemental downstream releases for fish passage as shown in Table 2-5. Downstream release requirements were met when Robles inflow was sufficient to do so. All flow was released downstream when inflow was less than the required supplemental release¹⁰.

**Table 2-5
WY 2019 Storm Peaks**

Month	Peak Storm Flow Rate (cfs) ¹¹
January 16, 2019	775
January 18, 2019	9,100-10,000
February 1, 2019	274-378
February 2, 2019	12,000-14,000
February 4, 2019	3,774
February 5, 2019	3,824
February 15, 2019	7,000
March 3, 2019	429
March 7, 2019	2,186

Coyote Creek and Santa Ana Creek drainages contribute directly to Lake Casitas storage. These gaging stations continue to be impacted by sediment transport and re-channelization following the 2017 Thomas Fire and are producing poor quality flow data. Direct inflow into Lake Casitas, which is reported in the Casitas Reservoir Operation data, was used as a surrogate for Coyote and Santa Ana Creeks as the major tributaries, but also accounts for other direct runoff including smaller tributaries such as Ayers, Chismahoo, Willow, and Poplin Creeks. Direct inflow is a zero sum calculation and accounts for change in Lake Casitas storage not accounted for by precipitation, Ventura River Diversions, evaporation, precipitation, and releases to the Marion Walker Water Treatment Plant. This value may be negative at times which is attributed to approximation in evaporation coefficients and water loss to infiltration. Only months with a positive direct inflow value are considered as a surrogate for true direct inflow into Lake Casitas and totaled 15,823 AF for WY 2019 with February 2019 accounting for 7,469 AF of total direct inflow as shown in Table 2-6¹².

¹⁰ Storm peak flows can be found in Appendix C.

¹¹ Storm flow is approximate.

¹² Direct inflow into Lake Casitas is shown in Appendix D.

2.3.Lake Storage and System Deliveries

Water storage volumes for system reservoirs, Casitas Dam and Matilija Dam, were ascertained by the daily recording of the reservoir elevation and applying the elevation number to a storage table for each reservoir. Casitas Reservoir data is included in Appendix C and Matilija Reservoir Data is provided in Appendix E. System delivery data for Mira Monte Well and the Ojai Water System can be found in Appendix F.

2.3.1. WY 2018

Lake Casitas Reservoir had a net decrease in water storage for WY 2018. Lake elevation was 493.38 feet above mean sea level (MSL) on October 1, 2017 and ended on September 30, 2018 at 483.30 feet above MSL, corresponding to 74,894 AF of storage in Lake Casitas at the end of the WY. The reservoir's 10.1-foot decrease in elevation resulted in a net loss of 12,927 AF. Storage increased by 2,117 AF during the three-month period of January through March; net monthly storage losses occurred outside of that period.

A new Casitas Reservoir storage rating table was adopted after completion of a LIDAR and bathymetric study resulting in a re-calculated reservoir capacity of 237,760 acre-feet (down from 254,000 acre-feet). This table was implemented on October 1, 2017 (start of WY 2018) and Casitas Reservoir storage reported from that date forward will reflect this adjustment.

Water deliveries from the reservoir to the main conveyance system totaled 11,633 AF for the Calendar Year. This is down 5 percent from 2017 and 29 percent from the average deliveries during the previous ten years. Mira Monte well production was 145 AF during WY 2018 and 151 AF during the 2018 Calendar Year. Deliveries within the Ojai Water System totaled 1,830 AF; 1,465 AF of which was sourced from the Ojai System Wellfield with the additional 364 AF coming from Lake Casitas.

¹³ N/A indicates the month is not applicable because the value was negative.

Casitas exercised water rights to divert water released from Matilija Dam. Water rights were not exercised for several years due to National Marine Fisheries Services (NMFS) concerns related to downstream biological-impacts. The County of Ventura is the owner of Matilija Dam and Casitas operates the valves for releases. At the request of the State of California Department of Water Resources Division of Safety of Dams (DSOD), the valves were operated in November 2017. Casitas did not conduct any controlled releases from Matilija Dam at the dam during the water year. All flow was allowed to spill over the dam for the entire water year.

2.3.2. WY 2019

Lake Casitas had a net increase in water storage for WY 2019. Lake elevation was 483.27 feet above MSL on October 1, 2018 and ended on September 30, 2019 at 502.36 feet above MSL, corresponding to 101,168 AF of storage in Lake Casitas at the end of the WY. The reservoir's 19.1-foot increase in elevation resulted in a net gain of 26,310 AF. Storage increased by 35,248 AF during the four-month period of January through April; net monthly storage losses occurred outside of that period.

Water deliveries from the reservoir to the main conveyance system totaled 7,668 AF for the Calendar Year. This is down 34 percent from 2018 and 51 percent from the average deliveries during the previous ten years. Mira Monte well production was 138 AF during WY 2019 and 124 AF during the 2019 Calendar Year. Deliveries within the Ojai Water System totaled 1,638 AF; 1,493 AF of which was sourced from the Ojai System Wellfield with the additional 145 AF coming from Lake Casitas.

Casitas exercised water rights to divert water released from Matilija Dam. Water rights were not exercised for several years due to National Marine Fisheries Services (NMFS) concerns related to downstream biological-impacts. The County of Ventura is the owner of Matilija Dam and Casitas operates the valves for releases. A contractor for the County of Ventura unclogged the dam piping and Casitas staff operated the valves on December 7, 2018. Critical Drought Protection Measures (CDPM) were implemented on March 3–4, 2019 in which approximately 101 AF was released from Matilija Dam and diverted to Lake Casitas¹⁴. Casitas, in collaboration with NMFS, aimed to minimize potential downstream biological impacts by releasing water from Matilija Dam following a storm peak on March 3, 2019 and during supplemental downstream releases for fish passage.

2.4. Ambient Air Temperatures

Data was recorded by CMWD staff at two locations, Casitas Dam and LCRA. These measurements are made on a daily basis and include the maximum and minimum ambient air temperatures and wind speed. This data is included in Appendix G.

2.4.1. WY 2018

Several temperature records dating back to 1960 were tied or broken during the 2018 calendar year: highest monthly maximum (July for Casitas Dam; January and July for LCRA), and highest monthly average (January for Casitas Dam; January and July for LCRA).

¹⁴ Results are based on inflow from the Robles canal download.

2.4.2. WY 2019

One temperature record dating back to 1960 was broken during the 2019 calendar year: highest monthly average (April for LCRA).

3. HYDROLOGY STATIONS

Table 3-1 shows responsible agencies for various hydrology stations throughout the watershed.

**Table 3-1
Hydrology Stations**

Type	Location	Agency
Reservoir	Casitas Dam	Casitas
Reservoir	Matilija Dam	VCWPD
Rainfall and Evaporation	LCRA	Casitas
Rainfall and Evaporation	Casitas Dam	Casitas
Rainfall	Matilija Dam	VCWPD
Rainfall	Thacher School	VCWPD
Streamflow	Matilija Creek at Matilija Hot Springs	Casitas/VCWPD
Streamflow	Ventura River Near Meiners Oaks	Casitas
Streamflow	Robles-Casitas Canal	Casitas
Streamflow	Ventura River near Ventura (Foster Park)	USGS
Streamflow	North Fork Matilija at Matilija Hot Springs	VCWPD
Streamflow	San Antonio Creek at Old Creek Road	VCWPD
Streamflow	Santa Ana Creek near Oak View	Casitas/VCWPD
Streamflow	Coyote Creek near Oak View	Casitas/VCWPD

3.1.Historical Hydrology Period 1959 through 2019

The historical data was updated for the reporting period and is presented in Figure 3-1 for the period from 1959 through 2019. The historical data includes summaries for the Casitas Reservoir operation, Robles Diversion, rainfall, and ambient air temperature. Storage volume, represented by a solid line, is reservoir storage at the start of each calendar year (elevation measured on last day of previous calendar year). Rainfall, represented by data points with drop lines, is the three-station water year average for Casitas Dam, LCRA, and Matilija Dam rain gages. Reservoir volume prior to 1970 (not shown) represents initial filling period after Casitas Dam completion in 1959¹⁵.

The change in Casitas Reservoir capacity was made due to performance of a bathymetric survey in 2017 which decreased the previously used 254,000 AF to 237,760 AF. This change combined with the 2017-2018 decrease in storage due to drought conditions presented a substantial loss in storage as shown in Figure 3-1.

¹⁵ Historical hydrology data is provided in Appendix H.

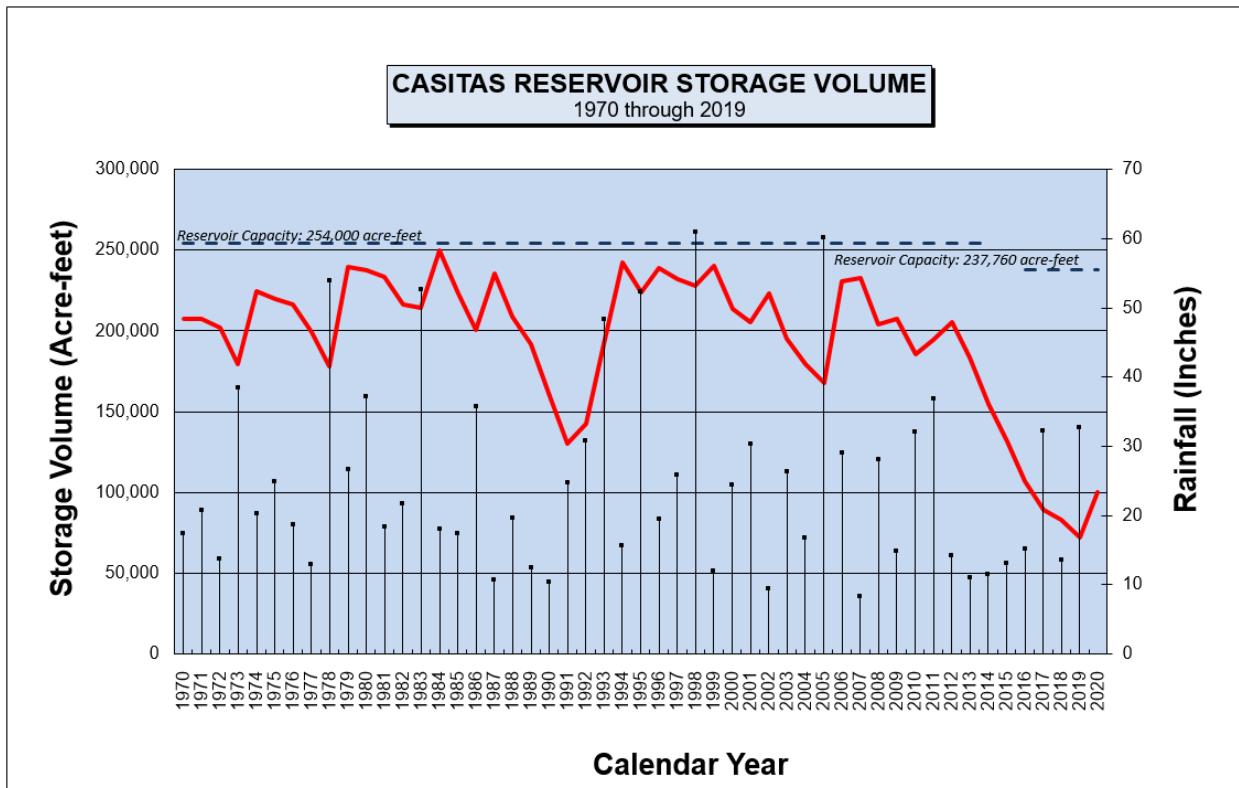

FIGURE 3-1 – Casitas Reservoir Storage Volume 1970-2019

3.2.Trends

The historical section of this summary report contains data tables and figures to illustrate trends experienced by CMWD pertaining to rainfall and water use.

3.2.1. Ten-Year Moving Average of Mean Precipitation

The trend presented in Figure 3-2 is a ten-year moving average of precipitation from 1880 to present and was created by calculating an average of a water year's three-station average rainfall combined with the previous nine years. The ten-year moving average is represented by the solid line traversing across the overall average for the period (24.4 inches). Rainfall data for all three stations are available since 1959, rainfall prior to 1959 was assembled using comparable nearby stations and/or correlation factors with other available stations within the watershed. The trend has resulted in what appears to be a somewhat sinusoidal curve, illustrating reoccurring periods of wet and dry conditions.

Estimated Inflow to Robles (cfs)

	<u>29 cfs</u>
Matilija W.S. Elevation	<u>1094.74 ft</u>
Matilija Creek @ Matilija Hot Spgs	<u>51 cfs</u>
North Fork Matilija Creek (cfs)	<u>N/A</u>
Lake Casitas W.S Elevation	<u>490.13 ft</u>

AS of 1/10/18
09:30

Initial Storm Peak

Date	<u>1/9/18</u>
Time	<u>06:15</u>
Matilija Dam Peak	<u>1102.67 cfs</u>
Flow (cfs)	<u>17,648 cfs</u> ← Too high?

Current day is _____ days after Peak. Matilija Crk
@ Matilija Hot Sprng

Peak: 1/9/18 06:10

9.04 ft / 6,202 cfs

Robles Release Requirements

Day	DATE	Robles Inflow	Table 2-3 Initial Rel.	Table 2-4 Selection	Release Schedule
1	1/10/18	29 cfs	≤ 50 cfs		50
2	1/11				40
3	1/12				30
4	1/13				30
5	1/14				30
6	1/15				30
7	1/16				30
8	1/17				30
9	1/18				30
10	1/19				30
11	1/20				30
12	1/21				30

OVERLAPPING EVENTS

Overlapping (OL) Storm Peak

Date

N/A

Days since OL Peak to < 600 cfs

Time

Table 2-6 Initial Release (cfs)

OL Peak Flow (cfs)

Table 2-7 Initial Release (cfs)

Days since initial Peak

OPERATOR INSTRUCTIONS

Fish Ladder Flow set at 50 cfs

Auxiliary Flow set at 0 cfs.

Diversion Setpoints:

Maximum 0

Minimum 0

Other Instructions:

Due to flows falling below 50 cfs, Set Day 1 release at 50 cfs Day 2 at 40 cfs and Day 3 through 12 at 30 cfs to smoothly close migration windows.
(Per B.O. Page 12)

As of 10-01-17; Rating table prepared by TetraTech used to calculate Casitas Reservoir Storage

Reservoir capacity = 237,761 acre-feet at 567 ft. elevation.

Direct reservoir inflow values may be negative due to inaccuracies of the evaporation coefficients (supplied by the USBR)

Evaporation and precipitation readings taken at approximately 8 a.m.

Monthly Evaporation Coefficients: Jan=0.65, Feb=0.77, Mar=0.76, Apr=0.80, May=0.81, Jun=0.82, Jul= Aug= Sep=0.76, Oct=0.75, Nov=0.72, Dec=0.66

Reservoir capacity = 237,761 acre-feet at 567 ft. elevation.

Direct reservoir inflow values may be negative due to inaccuracies of the evaporation coefficients (supplied by the USBR)

Evaporation and precipitation readings taken at approximately 8 a.m.

Monthly Evaporation Coefficients: Jan=0.65, Feb=0.77, Mar=0.76, Apr=0.80, May=0.81, Jun=0.82, Jul= Aug= Sep=0.76, Oct=0.75, Nov=0.72, Dec=0.66
